

Expand newborn screening !

Thanks to the BabyDetect test :

- Your child will benefit from a wider, extended newborn screening.
- You contribute to the progress made against severe diseases.

A few blood drops, to diagnose early enough!

Baby Detect is...

What ?

A test that enables screening at birth for more than 165 rare, serious, and treatable infantile diseases.

Why ?

This test can identify more than 165 genetic diseases before the first symptoms. This allows to treat the disease before it kicks in.

Who ?

For any newborn after the consent of their parents.

This test is currently at the parents' expense and is not reimbursed systematically. Talk to your insurance company to enquire about the coverage they offer.

Where ?

At the maternity, 2 days after birth.

How ?

As part of the official newborn screening program, a few drops of blood are collected from the baby to be screened and to detect 19 potential serious diseases. This is called the Guthrie test. With BabyDetect, we collect a few more drops to screen more than 165 diseases.

If an anomalous result is detected, you will be contacted by a specialist as soon as possible.

This test will NOT cause any harm or any additional discomfort to your baby.
